COMPANY OF THE MONTH

EAGLE IRON WORKS

For more than 150 years, Eagle Iron Works has offered customers reliable, easy-to-operate equipment to handle washing and classifying applications. With its full line of end-to-end washing equipment, EIW offers producers equipment for scrubbing, washing, classifying, dewatering, screening, mixing, tailings management and water recycling.

Eagle Iron Works prides itself in providing support from point of sale throughout the life of the machine, including readily available replacement parts. The company offers prompt engineering and design service for specialized applications, customer-specific requirements and complete plants. EIW also offers an extensive dealer network that aims to provide 24/7 local service and support.

SOLUTIONS

DEWATERING is the removal of excess moisture from an aggregate material to allow for better conveying and stockpiling of the final product.

MIXING allows the blending of two different materials into a consistent, uniform product.

SCRUBBING ensures products meet specifications by removing tough, stubborn clays and other deleterious materials from sound aggregate.

TAILINGS MANAGEMENT AND WATER RECYCLING allow producers to better manage their aggregate waste stream through liquid-solid separation, generating a drip-free solids material and an immediately reusable process water.

WASHING AND CLASSIFYING ensures aggregate products meet specifications by removing deleterious material such as clay, fines, silts, slimes, crusher dust, coatings and dirt.

GEAR REDUCER EXCHANGE PROGRAM

Eagle Iron Works classic gear reducers are known for their longevity, often outlasting the rest of the machine and, in some cases, even outlasting the site itself. Because not everyone requires a gear reducer that last for decades, EIW's Gear Reducer Exchange Program offers producers the ability to benefit from Eagle's gear reducer at a fraction of the cost.

EIW at CONEXPO 2026 – Booth C30814

During CONEXPO 2026, EIW will not only highlight the classic washing equipment for which it is known, but they will also display their newest piece of equipment that rounds out their end-to-end washing equipment line. The Hawk Fines Recovery Plant is designed to capture fine particles down to 400 mesh from process water and then discharge a stackable solids material. The system's modular design includes a Sump, Pump, Hydrocyclones and Dewatering Screen and can function as a standalone unit or as the first step in a larger tailing management system. CONEXPO will be the first time this field-proven machine will be displayed on a show floor for dealers and customers to see.

In addition to showcasing the Hawk Plant, EIW will also be offering hands-on maintenance training sessions led by our experts. From Classifying Tank valve adjustments to a preventative pump maintenance tour, attendees will be able to take home practical service techniques to keep their equipment running at peak performance.
